

Figure 1. Seven public cohorts test four inferential transitions

A. Each cohort contributes to defined claim-transition tests

ds004504 resting	Context	—	—	—
ds006036 visual	Direct	Context	—	—
ds005048 auditory	—	Direct	—	—
ds006222 audiovisual	Context	—	—	—
ds007648 36/40 Hz	—	Direct	—	Direct
ds006780 27/40 Hz	—	Direct	—	Direct
Dryad theta	—	—	Direct	Direct
	T1 Response → mechanism	T2 Reliability → cognitive validity	T3 Mean effect → within-person coupling	T4 Association → held-out prediction

Direct transition test Context or data boundary No direct role

B. Four stronger claims required evidence not supplied by the preceding result

Scope: human EEG secondary analyses; transition outcomes do not imply universal null effects, chronic efficacy, or disease modification.
